**Methaemoglobin Estimation**

Methemoglobin accumulation in erythrocytes is due to acquired or hereditary causes. There are many cases of acquired methemoglobin following to intoxication caused by substances which may form methemoglobin. Such substances may either exercise or direct oxidizing action, such as nitrites and nitrates or as following to some metabolic transformation in the organisms, such as of few medicines (salicylic acid, pyramidon, sulphamide) or derivatives used in industry (aniline, toluol, and benzol derivatives)
