An allergy screening test is a test that is used to determine whether or not a person sensitized to a particular allergen. There are many different types of allergies, and each type of allergy can be tested for with a different type of allergy screening test. The Phadiatop test is an allergy screening test with excellent sensitivity and specificity using ImmunoCAP technology. Normal IgE levels do not necessarily exclude the possibility of allergy, in these cases samples have been taken before the organism was able to produce antibodies against the antigen or test conducted after a long time of sensitization, hence IgE levels may be normal.

Sensitized individuals show elevated levels of specific allergens. Generally, higher the kUA/L value, more exposed the patient is to the allergen. However the levels do not correlate with the severity of symptoms. All results to be correlated with individual case history.
