Troponin T, Rapid Card

Cardiac Troponin is a cardiospecific, highly sensitive marker of myocardial damage, but is also expressed by diseased skeletal muscle. Troponin T levels rise in serum about 3-4 hours after appearance of cardiac symptoms and remain elevated upto 14 days. It is an independent prognostic marker which can predict near, mid and long term outcome in patients with Acute Coronary Syndrome (ACS). It is also a useful tool in guiding anti-thrombotic therapy. Patients with ischemic symptoms who have elevated Troponin T levels receive greater benefit from Antiplatelet and Antithrombotic therapies.

Uses

- Exclusion diagnosis of Acute Myocardial Infarction
- Monitoring Acute Coronary syndromes and estimating prognosis
 - Monitoring patients with non-ischemic causes of cardiac injury
