Anti Cyclic Citrullinated Peptide

A positive result for cyclic citrullinated peptide (CCP) antibodies indicates a high likelihood of rheumatoid arthritis (RA). It also helps in differentiating RA from other connective tissue diseases that may present with arthritis. It has also been found beneficial in diagnosis of early RA, within 3-6 months of onset of symptoms. Most studies have shown that Anti CCP antibodies have improved specificity for RA as compared to Rheumatoid factor antibody (RF). 30% patients with seronegative Rheumatoid arthritis (RF negative) show Anti CCP antibodies.
