SEROLOGY

# Epstein Barr Virus (EBV) Nuclear Antigen IgM Antibodies	0.30	<9.0 Negative 9.0 - 11.0 Indeterminate >11.0 Positive	Ratio
<i>Sample: Serum</i> <i>Method: ELISA</i>			

Epstein Barr Virus (EBV) Nuclear Antigen

Negative result does not rule out the possibility of Influenza A, B or H3N2 infection. Presence of inhibitors, mutations & insufficient organism RNA can affect the result. 2. RNase P serves as an internal control 3. Kindly consult referring Physician / Authorized Govt. hospital for appropriate followup
Comments Influenza Viruses can be broadly classified into Influenza A & B. H3N2 virus belongs to the family of Influenza A viruses. This assay detects 4 targets of which the first target detects Influenza A; second targets the H3 gene of Influenza A and thus is able to detect H3N2; third targets Influenza B; fourth target as RNase P gene serves as a positive control for the presence of human nucleic acid. RNase P target is usually positive in all samples.
