SEROLOGY

# Mumps IgG Antibodies	0.02	Negative: <0.35 Equivocal: >= 0.35 - <0.50 Positive: >= 0.50	RFV
<i>Sample: Serum</i>			
<i>Method: ALFA</i>			

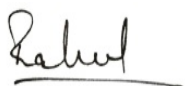

Mumps IgG Antibodies

<0.35	Negative	Presumed not to have had a specific immune response to immunization/in early acute phase of infection/no prior exposure to the mumps virus.
>=0.35-<0.50	Equivocal	It is recommended to repeat the test with a second sample after 2-3 weeks to demonstrate IgG seroconversion if recently vaccinated or if clinically indicated.
>=0.50	Positive	Indicates prior exposure to the mumps virus through infection or immunization.

?IgG antibodies to mumps virus may be present in serum specimens from individuals who have received blood products within the past several months but have not been immunized or experienced past infection with this virus.

1. Mumps virus shares antigenic relationships with other viruses of the paramyxovirus group; therefore, serologic cross-reactions may possible with those nonspecific antibodies.
