|-----------|--------|--------------------------|------|

### SEROLOGY

#### Toxoplasma IgG & IgM Antibodies

##### Toxoplasma IgG Antibodies

Sample: Serum  
Method: ECLIA

22.00 H

Negative : < 7.2  
Equivocal : 7.2 - 8.8  
Positive : > 8.8

IU/mL

##### Toxoplasma IgM Antibodies

Sample: Serum  
Method: ECLIA

12.00 H

Negative : < 6  
Equivocal : 6 - 8  
Positive : > 8

AU/mL

#### Toxoplasma IgG Antibodies

##### Interpretation:

Negative : Presumed not to have had previous exposure or recent infection with Toxoplasma gondii.  
Equivocal : May be due to low levels of IgG antibodies during the acute stage of infection. It is recommended to test those samples using a Toxoplasma IgM test, if clinically indicated.  
Positive: Indicates past or recent infection with Toxoplasma gondii.

##### Clinical Significance:

- A negative result does not always exclude the possibility of Toxoplasma gondii infection.
- A single positive Toxoplasma IgG result should not be used to diagnose recent infection.
- Recent or acute infection can be elicited by testing for Anti Toxoplasma gondii IgM antibody.
- A suspected diagnosis of acute toxoplasmosis should be confirmed by detection of Toxoplasma gondii in cerebrospinal fluid or amniotic fluid by PCR.

#### Toxoplasma IgM Antibodies

##### Interpretation

Negative Presumed not to have had active Toxoplasmosis infection.  
Equivocal May be due to low levels of IgM antibodies. These results should be retested with a second sample after 2 3 weeks, if clinically indicated.

### Report Status - Final

| Test Name | Result | Biological Ref. Interval | Unit |
|-----------|--------|--------------------------|------|
|-----------|--------|--------------------------|------|

Positive Indicates active Toxoplasmosis.

#### Clinical Significance:

● Nonreactive results do not preclude recent primary *Toxoplasma gondii* infection. A suspected diagnosis of acute toxoplasmosis should be confirmed by detection of *Toxoplasma gondii* nucleic acid in cerebrospinal fluid or amniotic fluid by PCR.
