SEROLOGY

Treponema Pallidum Hemagglutination Assay (TPHA)

Sample: Serum

Method: Hemagglutination

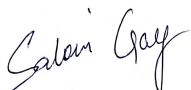

Reactive

TITER 1:160

Treponema Pallidum Hemagglutination

1. Syphilis is a chronic infection that progresses through distinct stages namely Primary, Secondary, Tertiary & Quaternary producing diverse clinical symptoms. The infection is caused by the Spirochaete *Treponema pallidum* acquired usually by sexual contact although the disease may be transmitted through blood transfusion and intra-uterine infection
2. TPHA Test is a particle agglutination assay for the semi-quantitative detection of antibodies to *Treponema pallidum* in human serum / plasma / CSF
3. Positive results indicate both past or present infections.
4. False positive results are seen in patients suffering from Leprosy, Infectious mononucleosis and Connective tissue disorders
5. This test does not distinguish between Syphilis and other pathogenic treponemal infections. All positive results should be confirmed with FTA-ABS (Fluorescent Treponemal Antibodies) test.
6. False negative results may be seen in early primary syphilis.
